

The water supply of Earth is a required element for life to exist and thrive. The water cycle is a continuous cycle that keeps water moving on and around Earth in different forms. The different stages of the water cycle include evaporation, condensation, precipitation, and collection. Each stage of the cycle leads to the next stage, and each stage is an important part of a process that helps to water plants, fill cisterns, dry up puddles, and remove floodwaters.

Aquifer: An aquifer is an underground layer that contains groundwater.

Atmosphere: A unit of atmosphere measures the air pressure at sea level, which is about 14.7 pounds per square inch.

Climate: The climate of a location includes all of the weather conditions for this location over an extended period of time.

Cloud: A cloud is a visible mass of small water droplets or tiny ice crystals that are suspended in the atmosphere.

Cloud Condensation Nuclei: Water vapor surrounds tiny particles, condensing in clouds to become raindrops.

Condensation: Condensation is the process by which water vapor changes into liquid.

Current: Currents are predictable and steady flows of fluid in a larger body of fluid.

Density: Density describes the amount of things in a specific space.

Dew Point: Dew point is the temperature at which water in the air condenses to become water droplets near the ground.

Ecosystem: An ecosystem is a community of living and nonliving things in an area.

Erosion: Erosion happens when soil is worn away, usually by wind, water, or ice.

Evaporation: Evaporation is the process of water changing into water vapor.

Evapotranspiration: When moisture from the soil evaporates into the atmosphere or when transpiration from plants occurs, this is called evapotranspiration.

Fog: Clouds near the ground are known as fog.

Freshwater: A lake, river, or spring is a source of freshwater, which animals can drink.

Glacier: A glacier is a mass of ice that moves slowly across a land mass.

Great Lakes: The Great Lakes are the biggest freshwater bodies of water in the world, located in the United States.

Greenhouse Gas: Gases in the atmosphere that absorb solar heat reflected by Earth's surface, contributing to warming of the atmosphere, are greenhouse gases.

Groundwater: Groundwater is water found in an aquifer.

Humidity: The amount of water vapor in the air is the humidity.

Ice: Ice is water in solid form.

Ice Cap: An ice cap is an area of less than 19,000 square miles covered by ice.

Ice Sheet: Ice sheets are glacial ice areas that cover a large expanse.

Lake: A lake is a body of water that is surrounded by land.

Microscopic: Microscopic describes something very small.

Pollutant: A pollutant is a substance that harms a natural resource.

Precipitation: Precipitation includes all types of water that fall to Earth.

River: A river is a big stream of fresh water that flows.

Runoff: When fluid overflows from a farm or factory, it's known as runoff.

Snowmelt: Melted water from snow is snowmelt.

Temperature: The level of heat or cold, measured by a thermometer, is temperature.

Transpiration: Water that evaporates from plants is transpiration.

Vapor: Vapor is liquid that is suspended in air.

Water Cycle: Water moves between the land, bodies of water, and atmosphere in a process known as the water cycle.

Weather: Weather describes the state of the atmosphere, and it includes atmospheric pressure, temperature, humidity, cloudiness, precipitation, and wind.

Wind: Wind is air that moves from areas of high pressure to low-pressure zones.

Learn More About Water!

- [What Is the Water Cycle?](#) The water cycle is the path water takes as it moves around on Earth.
- [The Water Cycle](#): Water never stops moving between land, bodies of water, and the air.
- [Learn About the Water Cycle](#): The sun helps to power the water cycle by causing evaporation.
- [Overview of the Water Cycle](#): The water cycle has no beginning and no end.
- [The Water Cycle](#): Earth only has a specific amount of water, and the water cycles continuously through stages such as evaporation, precipitation, and collection.
- [The Fundamentals of the Water Cycle](#): The water on Earth is always moving from one place and form to another.
- [The Water Cycle](#): As the sun shines, it turns water into a vapor that rises and eventually gathers as clouds.
- [Water Cycle Information](#): Without the water cycle occurring all the time, there couldn't be life on Earth.
- [The Water Cycle](#): Watch this video to learn how energy from the sun makes water move and change form in the water cycle.
- [Water Cycle: An Easy Explanation for Kids](#): The water cycle provides fresh water to plants and animals in a repeating process.
- [100 Ways to Conserve Water](#): Learn all the ways you can help to conserve water!
